

What is CASA?

The Clinic Assessment Software Application (CASA) is a tool for assessing immunization practices within a clinic, private practice, or any other environment where immunizations are provided. CASA has data entry and import capabilities. After immunization data has been entered into CASA, data analysis capabilities can be utilized to pinpoint strengths and areas of improvement for an individual provider. In addition to the analysis components of CASA, there are also reminder and recall tracking capabilities.

Immunization coverage level assessment software has been in existence in some form since 1986. The DOS version **CASA** was first released in 1992 with **CASA** for Windows being first released in 1997. Since its initial release, a number of changes have been made to **CASA** and its scope of use. The software is available on the National Immunization Program website at www.cdc.gov/nip/casa.
